- **Development Tools:** wordpress , webflow , wix , Framer
- **Design systems:** Google Material Design, Apple HIG , Ant Ui design, MUI
- Experience of handling more than 12+ linux distributions (Debian , Fedora & Arch)

PROJECTS :

A web scraping software:

I recently created a web scraping software in Python for my college final year project, which scrapes and collects data from university websites and stores it in tabular format. Furthermore, I transformed it into a website using PHP that does the same operation and is completely functional.

E-Commerce website for a client :

I got the opportunity to work on a client project that involved building an e-commerce website based on affiliate marketing and multi-level marketing. We built this site with WordPress as the foundation, and our primary goal is affiliate marketing, which is accomplished with the Ultimate Affiliates Pro plugin.

A service based E-commerce website

Then I was given the opportunity to work on an e-commerce project called go2do, which is a website for booking home appliance services. I worked as a frontend developer on the project to create a seamless UI with react js as the front end framework.
